(SUBSTITUTED)ACYL DIPEPTIDYL INHIBITORS OF THE
ICE/ced-3 FAMILY OF CYSTEINE PROTEASES

Technical Field

5 The present invention relates to novel classes of compounds which are inhibitors of interleukin-1 β converting enzyme and related proteases ("ICE/ced-3 family of cysteine proteases"), as well as to pharmaceutical compositions comprising these compounds and to methods of using such pharmaceutical compositions.

Background of the Invention

10 Interleukin 1 ("IL-1") is a major pro-inflammatory and immunoregulatory protein that stimulates fibroblast differentiation and proliferation, the production of prostaglandins, collagenase and phospholipase by synovial cells and chondrocytes, basophil and eosinophil degranulation and neutrophil activation. Oppenheim, J.H. *et al.*, *Immunology Today*, 7:45-56 (1986). As such, it is involved in 15 the pathogenesis of chronic and acute inflammatory and autoimmune diseases. IL-1 is predominantly produced by peripheral blood monocytes as part of the inflammatory response. Mosely, B.S. *et al.*, *Proc. Nat. Acad. Sci.*, 84:4572-4576 (1987); Lonnemann, G. *et al.*, *Eur. J. Immunol.*, 19:1531-1536 (1989).

IL-1 β is synthesized as a biologically inactive precursor, proIL-1 β . 20 ProIL-1 β is cleaved by a cysteine protease called interleukin-1 β converting enzyme ("ICE") between Asp-116 and Ala-117 to produce the biologically active C-terminal fragment found in human serum and synovial fluid. Sleath, P.R. *et al.*, *J. Biol. Chem.*, 265:14526-14528 (1992); A.D. Howard *et al.*, *J. Immunol.*, 147:2964-2969 (1991).

ICE is a cysteine protease localized primarily in monocytes. In addition 25 to promoting the pro-inflammatory and immunoregulatory properties of IL-1 β , ICE, and particularly its homologues, also appear to be involved in the regulation of cell

death or apoptosis. Yuan, J. *et al.*, Cell, 75:641-652 (1993); Miura, M. *et al.*, Cell, 75:653-660 (1993); Nett-Giordalisi, M.A. *et al.*, J. Cell Biochem., 17B:117 (1993). In particular, ICE or ICE/ced-3 homologues are thought to be associated with the regulation of apoptosis in neurodegenerative diseases, such as Alzheimer's and 5 Parkinson's disease. Marx, J. and M. Baringa, Science, 259:760-762 (1993); Gagliardini, V. *et al.*, Science, 263:826-828 (1994).

Thus, disease states in which inhibitors of the ICE/ced-3 family of cysteine proteases may be useful as therapeutic agents include: infectious diseases, such as meningitis and salpingitis; septic shock, respiratory diseases; inflammatory 10 conditions, such as arthritis, cholangitis, colitis, encephalitis, endocerolitis, hepatitis, pancreatitis and reperfusion injury, ischemic diseases such as the myocardial infarction, stroke and ischemic kidney disease; immune-based diseases, such as hypersensitivity; auto-immune diseases, such as multiple sclerosis; bone diseases; and certain neurodegenerative diseases, such as Alzheimer's and Parkinson's disease. Such 15 inhibitors are also useful for the repopulation of hematopoietic cells following chemo- and radiation therapy and for prolonging organ viability for use in transplantation.

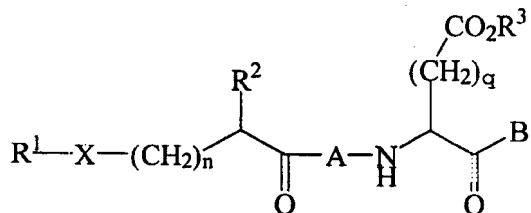

ICE/ced-3 inhibitors represent a class of compounds useful for the control of the above-listed disease states. Peptide and peptidyl inhibitors of ICE have 20 been described. However, such inhibitors have been typically characterized by undesirable pharmacologic properties, such as poor oral absorption, poor stability and rapid metabolism. Plattner, J.J. and D.W. Norbeck, in Drug Discovery Technologies, C.R. Clark and W.H. Moos, Eds. (Ellis Horwood, Chichester, England, 1990), pp. 92-126. These undesirable properties have hampered their development into effective drugs.

25 Accordingly, the need exists for compounds that can effectively inhibit the action of the ICE/ced-3 family of proteases, for use as agents for preventing unwanted apoptosis and for treating chronic and acute forms of IL-1 mediated diseases, such as inflammatory, autoimmune or neurodegenerative diseases. The present invention satisfies this need and provides further related advantages.

Summary of the Invention

In general, the compounds of this invention incorporate an aryl or heteroaryl substituted acyl group as a dipeptide mimetic. The resulting compounds exhibit improved properties relative to their peptidic counterparts, for example, such as 5 improved cell penetration or improved absorption and metabolic stability resulting in enhanced bioavailability.

synthetic schemes, q is 1, and corresponding compounds wherein q is 2 may be made in the same manner by employing the corresponding ethylene (-CH₂CH₂-) starting material in place of the methylene (-CH₂-) moiety.

One synthetic route for synthesizing the instant compounds is set forth in
5 the following Scheme 1:

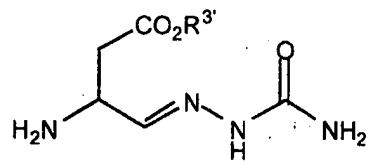

SCHEME 1

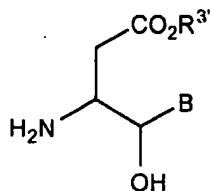

In the above Scheme 1, Formula (V), that is H₂N—C, is a modified aspartic acid residue of Formulas Va through Vd:

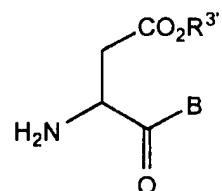

Formula Va;

Formula Vb;

Formula Vc; or

Formula Vd.

In the above Scheme 1, "PG" stands for an amino protecting group and "A" stands for a natural or unnatural amino acid of formula IIa through IIi, as discussed above. In Formula Vb through Vd, R³ is a carboxyl protecting group as described in the 5 definition of R³ in Formula I with the exception that R³ cannot be a hydrogen atom.

The modified aspartic acids of Formula Va-d can be prepared by methods well known in the art. See, for example, European Patent Application 519,748; PCT Patent Application No. PCT/EP92/02472; PCT Patent Application No. PCT/US91/06595; PCT Patent Application No. PCT/US91/02339; European Patent 10 Application No. 623,592; World Patent Application No. WO 93/09135; PCT Patent Application No. PCT/US94/08868; European Patent Application No. 623,606; European Patent Application No. 618,223; European Patent Application No. 533,226; European Patent Application No. 528,487; European Patent Application No. 618,233; PCT Patent Application No. PCT/EP92/02472; World Patent Application No. WO 15 93/09135; PCT Patent Application No. PCT/US93/03589; and PCT Patent Application No. PCT/US93/00481, all of which are herein incorporated by reference.

The coupling reactions carried out under Step A are performed in the presence of a standard peptide coupling agent such as the combination of the combination of dicyclohexylcarbodiimide(DCC) and 1-hydroxy-benzotriazole(HOBt), 20 as well as the BOP (benzotriazolyloxy-tris-(dimethylamino)phosphonium

hexafluorophosphate) reagent, pyBOP (benzotriazolyloxy-tris(N-pyridinyl)phosphoniumhexafluorophosphate), HBTU (O-benzotriazolyly-tetramethylisouronium-hexafluorophosphate), and EEDQ (1-ethyloxycarbonyl-2-ethyloxy-1,2-dihydroquinoline) reagents, the combination of 5 1-ethyl(3,3'-dimethyl-1'-aminopropyl)carbodiimide (EDAC) and HOBr, and the like, as discussed in J. Jones, "Amino Acid and Peptide Synthesis," Steven G. Davis ed., Oxford University Press, Oxford, pp. 25-41 (1992); M. Bodanzky, "Principles of Peptide Synthesis," Hafner *et al.* ed., Springer-Verlag, Berlin Heidelberg, pp. 9-52 and pp. 202-251 (1984); M. Bodanzky, "Peptide Chemistry, A Practical Textbook," 10 Springer-Verlag, Berlin Heidelberg, pp. 55-73 and pp. 129-180; and Stewart and Young, "Solid Phase Peptide Synthesis," Pierce Chemical Company, (1984), all of which are herein incorporated by reference. The amino protecting group is then removed and the resulting amine is coupled to the (substituted) carboxylic acid of 15 Formula VII (Step B). Again, this coupling reaction uses the standard peptide coupling reactions mentioned above.

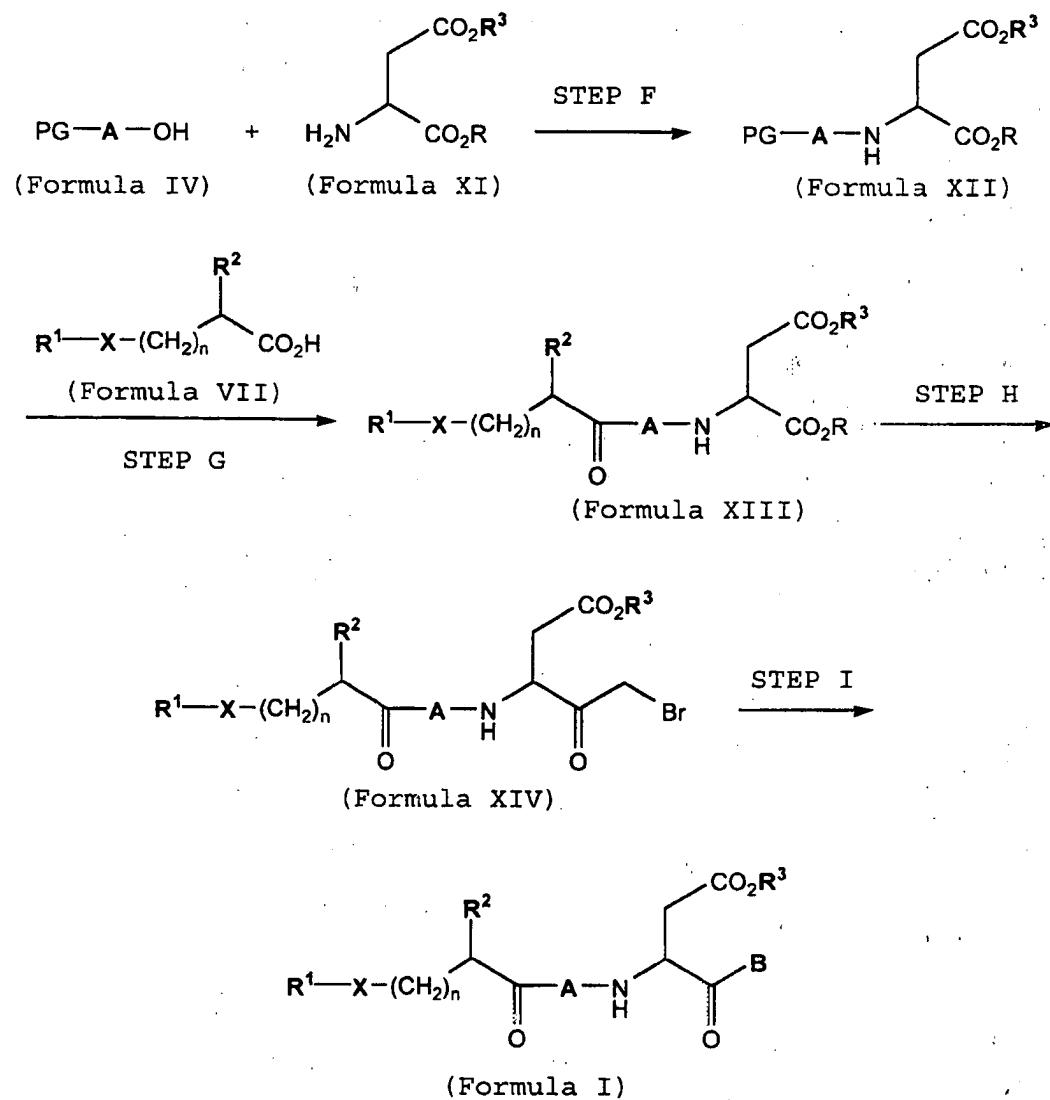

Alternatively, the (substituted)carboxylic acid of Formula VII can be coupled to an amino ester of Formula IX (Step D). Again, this coupling reaction uses the standard peptide coupling reactions mentioned above. In Formula IX, the group R is a carboxyl protecting group such as methyl, allyl, benzyl or tert-butyl. After removal of 20 the carboxyl protecting group under standard conditions well known in the art, the resulting carboxylic acid is coupled to amine V using the standard peptide coupling methods described above (Step E).

In the case where the coupling reaction depicted by either Step A or Step E was carried out with the amino alcohol of Formula Vc, the alcohol moiety must be 25 oxidized to the corresponding carbonyl compound prior to removal of the protecting groups. Preferred methods for the oxidation reaction include Swern oxidation (oxaly chloride-dimethyl sulfoxide, methylene chloride at -78°C followed by triethylamine); and Dess-Martin oxidation (Dess-Martin periodinane, t-butanol, and methylene chloride.) The protecting groups contained in substructures of the Formula Va-d, VII

and A are removed by methods well known in the art. These reactions and removal of some or all of the protecting groups are involved in Step C in the above Scheme 1.

An alternative synthetic route for synthesizing the instant compounds is set forth in the following Scheme 2:

SCHEME 2

In the above Scheme 2, "PG" stands for an amino protecting group and "A" stands for a natural or unnatural amino acid of formula IIa through IIi, as discussed

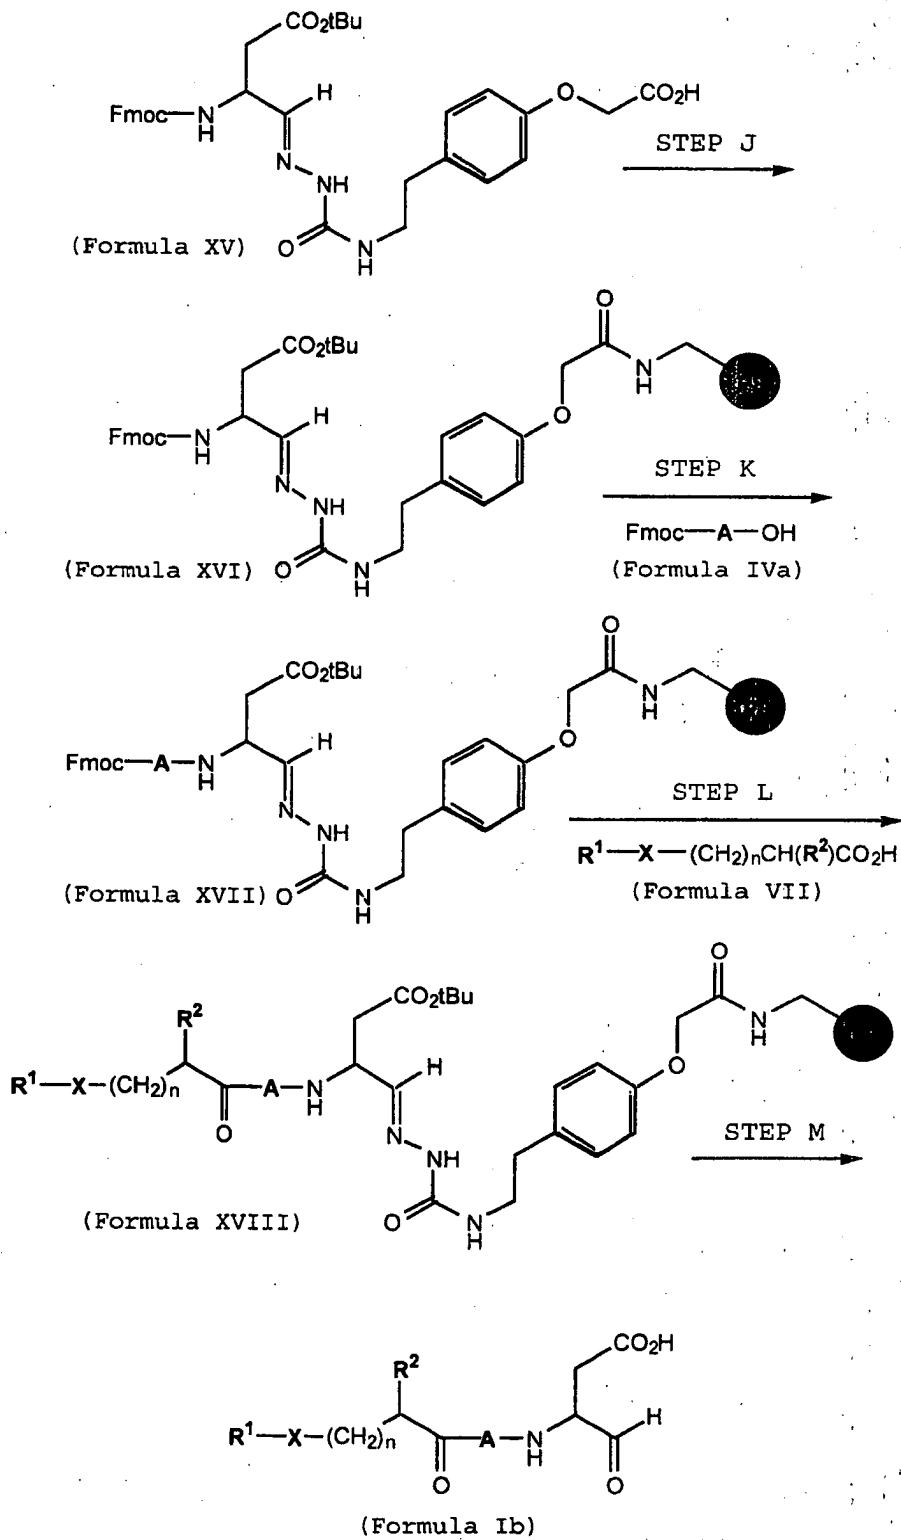

above. The group R is a carboxyl protecting group such as trimethylsilyl, methyl, allyl, benzyl or tert-butyl.

The coupling reactions carried out under Step F and Step G are performed in the presence of a standard peptide coupling agent as discussed above. In 5 Step G, the amino protecting group must be removed prior to the coupling step. In Step H the alpha-carboxy protecting group R of the compound of Formula XIII is selectively removed and the resulting mono-carboxylic acid treated sequentially with diazomethane and hydrobromic acid to give the alpha-bromoketone of Formula XIV.

In Step I, the bromoketone of Formula XIV is treated with either 10 $R^{16}Z$ -H, (aryl)-CO₂H, (heteroaryl)-CO₂H, or $R^{17}(R^{18})PO_2H$ in the presence of an inorganic base such as potassium carbonate or potassium fluoride in an inert solvent such as dimethyl formamide to give the corresponding compound of Formula I in which B is CH_2ZR^{16} , CH_2OCO (aryl), CH_2OCO (heteroaryl), or $CH_2OPO(R^{17})R^{18}$, respectively. Compounds of Formula I in which B is a fragment of Formula III may 15 also be prepared in a similar fashion. The protecting groups contained in substructures of the Formula VII, XI and A are removed by methods well known in the art. These reactions and removal of some or all of the protecting groups are involved in Step I in the above Scheme 2.

An alternative method for the preparation of compounds of the instant 20 invention of Formula I in which R³ and B are both hydrogen (*i.e.*, Formula Ib) is set forth below in Scheme 3:

SCHEME 3

In Scheme 3, Fmoc is the amino protecting group 9-fluorenylmethoxycarbonyl and the shaded circle labeled "PS" represents polystyrene resin.

The coupling of the acid of Formula XV to a primary amine on solid support, preferably aminomethyl polystyrene, is carried out using standard peptide coupling agents, preferably using benzotriazolyloxy-tris(N-pyrrolidinyl)phosphoniumhexafluorophosphate (pyBOP) in a inert solvent such as dimethylformamide or N-methyl pyrrolidone (Step J). After removal of the Fmoc protecting group of XVI by treatment with pyrrolidine-dimethylformamide, the resulting amine is coupled to Fmoc-amino acid of Formula IVa using standard peptide coupling conditions as discussed above (Step K).

In Step L the Fmoc protecting group of the compound of Formula XVII is removed again by treatment with pyrrolidine-dimethylformamide and the resulting amine coupled to the (substituted)carboxylic acid of Formula VII again using standard peptide coupling conditions as discussed above. The tert-butyl ester of the compound of Formula XVIII is removed by treatment with trifluoroacetic acid-methylene chloride in the presence of a trapping agent such as anisole and the resulting acid cleaved from the solid support by treatment with 37% aqueous formaldehyde/acetic acid/tetrahydrofuran/ trifluoroacetic acid, preferably in a ratio of 1/1/5/0.025, to give the aspartyl aldehyde of Formula Ib (Step M).

Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water. The disease states which may be treated or prevented by the instant pharmaceutical compositions include, but are not limited to, inflammatory diseases, autoimmune diseases and neurodegenerative diseases, and for inhibiting unwanted apoptosis involved in ischemic injury, such as ischemic injury to the heart (e.g., myocardial infarction), brain (e.g., stroke), and kidney (e.g., ischemic kidney disease). As a consequence of their ability to inhibit apoptosis, the present pharmaceutical compositions are also useful for the repopulation of hematopoietic cells of a patient following chemotherapy. Methods of administering an effective amount of the
20 above-described pharmaceutical compositions to mammals, also referred to herein as patients, in need of such treatment (that is, those suffering from inflammatory diseases, autoimmune diseases, neurodegenerative diseases and for the repopulation of hematopoietic cells in cancer patients who have undergone chemotherapy) are another aspect of the instant invention. Finally, as a further consequence of their ability to
25

inhibit apoptosis, the instant pharmaceutical compositions may be used in a method to prolong the viability of organs to be used in transplantations.

Inflammatory disease which may be treated or prevented include, for example, septic shock, septicemia, and adult respiratory distress syndrome. Target diseases associated with harmful, apoptosis, in other words, those associated with ischemic injury, includes myocardial infarction, stroke, and ischemic kidney disease. The pharmaceutical compositions of this invention may 15 also be used to treat infectious diseases, especially those involved with viral infections.

The term "effective amount" refers to dosage levels of the order of from about 0.05 milligrams to about 140 milligrams per kilogram of body weight per day for use in the treatment of the above-indicated conditions (typically about 2.5 milligrams to about 7 grams per patient per day). For example, inflammation may be effectively 20 treated by the administration of from about 0.01 to 50 milligrams of the compound per kilogram of body weight per day (about 0.5 milligrams to about 3.5 grams per patient per day).

The amount of the compounds of Formula I that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host 25 treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 milligrams to 5 grams of a compound of Formula I combined with an appropriate and convenient amount of a pharmaceutically-acceptable carrier which may vary from about 5 to about 95 percent of the total composition. Dosage unit forms will generally contain between from about 30 1 milligram to about 500 milligrams of an active compound of Formula I.

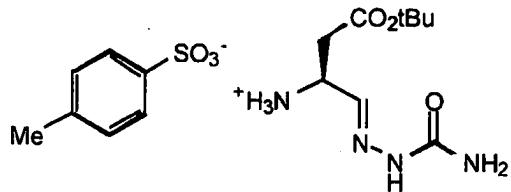

It will be understood, however, that the specific "effective amount" for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the 5 severity of the particular disease undergoing prevention or therapy.

Although this invention focuses on the use of the compounds disclosed herein for preventing and treating IL-1-mediated diseases, the compounds of this invention can also be used as inhibitory agents for other cysteine proteases.

PREPARATION 1

**Preparation of (3S)-Amino-4-Oxobutanoic Acid
tert-Butyl Ester Semicarbazone, p-Toluenesulfonate Salt**

5 Part A: N-(Benzylloxycarbonyl)-L-(N'-Methyl-N'-Methoxy)aspartamide β -(tert-Butyl) Ester

To a solution of N-(benzylloxycarbonyl)-L-aspartic acid- β -(tert-butyl) ester (14.65 g, 45.3 mmol, Bachem) in CH₂Cl₂ (150 mL) at 0°C (ice bath) under a nitrogen atmosphere was added 1-hydroxybenzotriazole hydrate (7.29 g, 47.6 mmol, 10 Aldrich) followed by 1-ethyl-3-(3',3'-dimethyl-1'-aminopropyl)carbodiimide hydrochloride (9.55 g, 49.8 mmol, Sigma). After stirring at 0°C for 15 min., N,O-dimethylhydroxylamine hydrochloride (5.10 g, 52.3 mmol, Aldrich) and N-methylmorpholine (5.8 mL, 53 mmol, Aldrich) were added. The mixture was allowed to warm to room temperature over 3 hours then stirred at room temperature for 16 hours. The solution was concentrated under vacuum and the residue partitioned between ethyl acetate-5% KHSO₄ (200 mL each). The organic phase was washed in turn with 5% KHSO₄, saturated sodium bicarbonate and saturated sodium chloride solutions; dried over anhydrous sodium sulfate and evaporated to an oil. The oil was crystallized from hexane to give the title product (16.10 g, 97% yield) as a fluffy white 15 crystalline solid. TLC (ethyl acetate), single spot (UV and PMA): R_f=0.37.

20

A similar procedure to the one above, starting with 29.3 g of N-(benzylloxycarbonyl)-L-aspartic acid- β -(tert-butyl)ester (2-fold scale up) gave 31.18 g (94% yield) of the title product.

Part B: (3S)-(Benzylloxycarbonyl)Amino-4-Oxobutanoic Acid tert-Butyl Ester
Semicarbazone

To a solution of N-(benzylloxycarbonyl)-L-(N'-methyl-N'-methoxy)aspartamide- β -(tert-butyl) ester (15.50 g, 42.3 mmol) in anhydrous ether (400 mL) at 0°C (ice bath) under a nitrogen atmosphere was added dropwise to a 1.0 M solution of LiAlH₄ in ether (22.0 mL, 22.0 mmol, Aldrich) at such a rate as to keep the reaction solution temperature between 0-5°C (addition time 15-20 min). After the addition of the lithium aluminum hydride reagent was complete, the mixture was stirred at 0-5°C for 1 hr, then quenched by the dropwise addition of 0.3 N KHSO₄ solution (100 mL). The resultant mixture was transferred to a separatory funnel adding sufficient 5% KHSO₄ solution (75 mL) to dissolve the solids. The organic phase was separated and the combined aqueous washes back-extracted with ether (100 mL). The combined ether extracts were washed with saturated NaCl solution, dried over anhydrous sodium sulfate and concentrated in vacuo with minimal heating. TLC (ethyl acetate): streaky spot (UV and PMA) R_f=0.48. TLC (methanol/methylene chloride, 1:9) major spot (UV and PMA): R_f=0.75.

The crude aldehyde was immediately taken up in aqueous ethanol (45 mL water/105 mL alcohol), placed in an ice bath and treated with sodium acetate (3.82 g, 46.6 mmol) and semicarbazide hydrochloride (5.20 g, 46.6 mmol, Aldrich). The mixture was stirred at 0°C (ice bath) under a nitrogen atmosphere for 3 hrs, allowed to warm to room temperature, and stirred overnight (16 hrs). Most of the ethanol was removed under vacuum and the residue partitioned between ethyl acetate and water (100 mL each). The organic phase was washed sequentially with 5% KHSO₄, saturated sodium bicarbonate and saturated sodium chloride solutions; dried over anhydrous sodium sulfate and evaporated to dryness. The crude product of this reaction was combined with that of two similar procedures starting with 15.40 g and 4.625 g of N-(benzylloxycarbonyl)-L-(N'-methyl-N'-methoxy)aspartamide- β -(tert-butyl ester) (total: 35.525 g, 97 mmol) and these combined products were purified by flash chromatography on silica gel eluting with acetone/methylene chloride (3:7) then methanol-acetone-methylene chloride (0.5:3:7) to give pure title product (27.73 g,

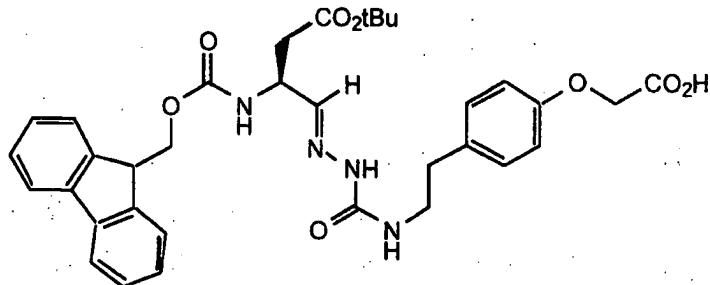

78.5%) as a colorless foam. TLC (MeOH-CH₂Cl₂, 1:9): single spot (UV and PMA), R_f=0.51.

Part C: (3S)-Amino-4-Oxobutanoic Acid tert-Butyl Ester Semicarbazone, p-Toluenesulfonate Salt

5 To a solution of (3S)-(benzyloxycarbonyl)amino-4-oxobutanoic acid tert-butyl ester semicarbazone (13.84 g, 38.0 mmol) in absolute ethanol (250 mL) was added 10% Pd/C (1.50 g, Aldrich) and the resulting mixture stirred under an atmosphere of hydrogen (balloon) until TLC (methanol/methylene chloride, 1:9) indicated complete consumption of the starting material (60 min). Note: It is important
10 to follow this reaction closely since the product can be over-reduced. The mixture was filtered through Celite and evaporated to an oil. The oil was chased with methylene chloride (2 x 75mL) then with methylene chloride/toluene (1:1, 75 mL) to give the crude amine as a white crystalline solid. TLC (EtOAc-pyridine-AcOH-H₂O; 60:20:5:10) single spot (UV and PMA) R_f=0.24. Note: In this TLC system, any over-reduced product will show up immediately below the desired product, R_f=0.18 (PMA
15 only).

The crude amine was taken up in CH₃CN (60 mL) and treated with a solution of p-toluenesulfonic acid monohydrate (7.22 g, 38.0 mmol) in acetonitrile (60 mL). The crystalline precipitate was collected, washed with acetonitrile and ether, and
20 air-dried to give the title compound (13.95 g, 92% yield) as a white, crystalline solid.

The optical purity of this material was checked by conversion to the corresponding Mosher amide [1.05 equiv (R)-(-)- α -methoxy- α -(trifluoromethyl)phenylacetyl chloride, 2.1 equivalents of i-Pr₂NEt in CH₂Cl₂, room temperature, 30 min]. The desired product has a doublet at 7.13 ppm (1H, d, J=2.4 Hz, CH=N) while the corresponding signal for its diastereomer is at 7.07 ppm. The optical purity of the title compound obtained from the above procedure is typically > 95:5.

After stirring at room temperature for 1 hr, the resulting clear solution was treated with methyl bromoacetate (7.5 mL, 79 mmol) and cesium carbonate (17.5 g, 53.7 mmol). After stirring at room temperature for 16 hrs, TLC (Et_2O -toluene; 2:8) shows some unalkylated material remained ($R_f = 0.43$) and a second portion of methyl bromoacetate (2.0 mL, 21 mmol) and cesium carbonate (4.5 g, 14 mmol) were added. After stirring at room temperature for 1 hr, the mixture was acidified with conc. HCl and extracted with 25 EtOAc (100 mL). The organic phase was washed with saturated NaCl solution, dried over anhydrous Na₂SO₄ and evaporated to a white solid. Recrystallization of the crude product from THF-EtOAc-hexane gave the title compound (13.44, 95%) as a white crystalline solid. TLC (AcOH-MeOH-CH₂Cl₂; 1:1:8) R_f = 0.31.

The mixture was allowed to warm to room temperature over 2 hours then stirred at room temperature for 16 hours. The solution was concentrated under vacuum and the residue partitioned between ethyl acetate-5% 20 KHSO₄ (200 mL each). The organic phase was washed successively with 5% KHSO₄, saturated sodium bicarbonate and saturated sodium chloride solutions; dried over anhydrous sodium sulfate and evaporated to an oil. Purification of the crude product by flash chromatography on silica gel eluting with EtOAc-hexane (30:70 then 35:65) gave the title product (17.75 g, 98% yield) as a colorless foam. TLC (EtOAc-hexane; 1:1) 25 R_f=0.35.

PREPARATION 3

Assay for Inhibition of ICE/ced-3 Protease Family Activity

A. Determination of IC₅₀ Values

Fluorescence enzyme assays detecting the activity of the compounds of Formula 1 utilizing the recombinant ICE and CPP32 enzymes are performed essentially according to Thornberry *et al.* (*Nature*, 356:768:774 (1992)) and Nicholson *et al.* (*Nature*, 376:37-43 (1995)) respectively, (herein incorporated by reference) in 96 well microtiter plates. The substrate is Acetyl-Tyr-Val-Ala-Asp-amino-4-methylcoumarin (AMC) for the ICE assay and Acetyl-Asp-Glu-Val-Asp-amino-4-methylcoumarin for the CPP32, Mch2, Mch3 and Mch5 assays. Enzyme reactions are run in ICE buffer (25 mM HEPES, 1 mM EDTA, 0.1% CHAPS, 10% sucrose, pH 7.5) containing 2 mM DTT at room temperature in duplicate. The assays are performed by mixing the following components:

50 μ L ICE, Mch2, Mch5, CPP32 (18.8, 38, 8.1 and 0.153 nM concentrations, respectively) or Mch3 (1 unit) enzyme in ICE buffer containing either 8.0 (ICE, Mch2, Mch3, CPP32) or 20 (Mch5) mM DTT;

15 50 μ L compound of Formula 1 or ICE buffer (control); and

100 μ L of 20 μ M substrate.

20 The enzyme and the compound of Formula I to be assayed are allowed to preincubate in the microtitre plate wells for 30 minutes at room temperature prior to the addition of substrate to initiate the reaction. Fluorescent AMC product formation is monitored for one hour at room temperature by measuring the fluorescence emission at 460 nm using an excitation wavelength of 360 nm. The fluorescence change in duplicate (control) wells are averaged and the mean values are plotted as a function of inhibitor concentration to determine the inhibitor concentration producing 50% inhibition (IC₅₀). The results of this assay are set forth below in Table 1 and in Table 3 (for Table 3, see Examples 11 through 52).

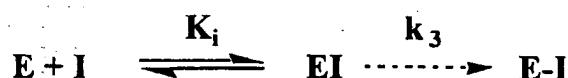

The reference compound for this assay was Cbz-ValAlaAsp-H and the values are denoted in Table 1 as "Reference".

5 B. Determination of the dissociation constant K_i and irreversible rate constant k₃ for irreversible inhibitors

For the irreversible inhibition of a ICE/ced-3 Family Protease enzyme with a competitive irreversible inhibitor; using the model represented by the following formulas:

10

The product formation at time t may be expressed as:

$$[P]_t = [E]^T \left(\frac{[S]K_i}{[I]K_s} \right) \left(\frac{k_s}{k_3} \right) \left[1 - e^{-k_3 t / (1 + \frac{K_i}{[I]} (1 + \frac{[S]}{K_s}))} \right]$$

Equation 1

where E, I, EI and E-I denote the active enzyme, inhibitor, non-covalent enzyme-inhibitor complex and covalent enzyme-inhibitor adduct, respectively. The K_i value is the overall dissociation constant of the reversible binding steps, and k_3 is the irreversible rate constant. The $[S]$ and K_s values are the substrate concentration and dissociation constant of the substrate bound to the enzyme, respectively. $[E]^T$ is the total enzyme concentration.

The above equations were used to determine the K_i and k_3 values of a given inhibitor bound to a ICE/ced-3 family protease. Thus, a continuous assay was run for sixty minutes at various concentrations of the inhibitor and the substrate. The assay was formulated essentially the same as described above for generating the data in Table 1, except that the reaction was initiated by adding the enzyme to the substrate-inhibitor mixture. The K_i and k_3 values were obtained by simulating the product AMC formation as a function of time according to Equation 1. The results of this second assay are set forth below in Table 2.

The reference compound for this assay was Cbz-ValAlaAsp-CH₂F and the values are denoted in Table 2 as "Reference". The K_i values in Table 2 are in micromolar (μ M). The k_3/K_i values are in moles⁻¹ seconds⁻¹ (M⁻¹s⁻¹).

To a stirred and cooled (-15 C) solution of methyl 4-(1H-1,2,3,4-tetrazole-5-yl)(2S)-2-[(phenylmethoxy) carbonylamino] butanoate (4.0 g, 12.53 mmol) 5 and triethylamine (2.62 ml, 18.79 mmol) in DCM (50 ml) was added α -chloromethyl methyl ether (MOMCl, 1.43 ml, 18.79 mmol). The stirring was continued for 2.5 hours and by which time the cold bath was warmed to 0 C. The solution was diluted with saturated aqueous NaHCO₃ (100 ml) and the layers were separated. The aqueous layer was back extracted with DCM (100 ml). The combined organic layers were dried 10 (Na₂SO₄) and evaporated. Flash chromatography of the residue over silica gel (4.5 x 18 cm), using 20, 40, 60, and 80% ethyl acetate in hexanes, gave compound 196-a (1.977 g, 43%) and compound 196-b (2.574 g, 56%). The structures of compounds were tentatively assigned based on proton NMR experiments according to literature (R. Raap, *et al*, *Can. J. Chem.* 1968, 47, 813). Compound 196-a has: ¹H-NMR (CD₃OD, 15 300 MHz) δ 2.00--2.40 (m, 2 H), 3.00 (t, 2 H), 3.40 (s, 3 H), 3.70 (s, 3H), 4.20--4.35 (m, 1 H), 5.10 (s, 2 H), 5.82 (s, 2H), 7.22—7.40 (m, 5 H). The aqueous solution was back-extracted with ethyl acetate and the combined extracts were washed with saturated NaHCO₃ and brine, dried over sodium sulfate, and concentrated to give a solid. Trituration with ether afforded of
15 N-[carbobenzyloxycarbonyl valinyl] aspartic acid, α -methyl, β -tert-butyl diester as a white solid (8.36 g, 92%). TLC (CH₂Cl₂ / MeOH, 95 / 5): R_f = 0.48.

20 A solution of the above product (4.00 g, 9.17 mmol) in 200 ml of methanol was stirred with palladium on activated carbon (0.45 g) under an atmosphere of hydrogen (1 atm) for 50 min. The reaction mixture was then filtered through a pad of Celite and the filter cake was washed with methanol and methylene chloride. The filtrates were combined and concentrated, and the residue was chased with methylene chloride to give N-[valinyl] aspartic acid, α -methyl, β -tert-butyl diester as a white solid (2.75 g, 99%). TLC (CH₂Cl₂ / MeOH, 95 / 5): R_f = 0.10.

INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: 41-46 because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 41-46 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claim(s) may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of the claim(s) is impossible. Consequently, the search has been restricted to:..... The structure according to claim 1, formula 1, with:

R2 = not a hydrogen atom

R3 = H

q = 1

Although the search was restricted to the above criteria, the search revealed some of the compounds excluded by this restriction: see W09630395 for q = 2. See GB2292149 and W09309135 for R3 = alkyl (these documents are cited in the Search Report)

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
